

# Wash your diapers in the right way!

## **Diaper changing**

When a diaper is used, rinse it with cold water and wring it out properly. Add the half wet diapers in a bucket. You do not need to add water or anything else in the bucket, diapers can be up to 3 days.

## **Washing**

The diapers and diaper covers are usually washed at 60°C in Zeolite free detergent. In order to get extra clean diapers, wash at 90°C. Close the Velcro on the covers. Don't open in wet condition, it will wear out the Velcro.

## **Washing the Wool Diaper Cover**

Machine washable but we recommend hand washing with mild soap or wool detergent. After washing squeeze the covers in a towel to save drying time. Treat with wool cure once or twice a month. Things to consider: Pee is highly corrosive to the wool fiber and it's therefore important not to allow the cover to be wet for too long.

## **Drying**

Hang dry. You can also tumble dry on **low** heat, but it wears the fabric.

## **Fabric softener**

Do not use fabric softener because it leaves a coating on the fabric that prevents the diapers from absorbing.

## **Bleach**

Avoid using bleach on diaper covers. However, when required, you can use bleach on cloth diapers.

## **New diapers**

Always wash new cloth diapers before use, it increases the absorption. Diaper covers can however be used directly without washing.

## **Nice advice!**

- **Wash the diapers along with other laundry to save energy.**
- **If you use Muslin Squares, fold them "ready to go" after washing. The diaper changes will go much faster.**
- **At diaper change, rinse the diaper with a shower hose in the toilet. You can also hold the diaper in the toilet bowl and flush.**
